

CSE370 Final Guidelines

Final Syllabus:

- ER/EER

Things to keep in mind:

<p>Strong entity</p> 	<p>Weak entity</p> 	<p>Simple Attributes</p> 
<p>Partial Attribute</p> 	<p>Multivalued Attribute</p> 	<p>Composite Attribute</p> 
<p>Key Attribute</p> 	<p>Relationship</p> 	<p>Identifying Relationship</p> 
<p>Recursive Relationship</p> 	<p>Total Participation \Rightarrow</p> <p>Optional Participation \Rightarrow</p>	<p>SuperClass/SubClass</p> 
<p>Cardinality Ratio</p> <p>1:1 \Rightarrow One to One,</p> <p>1:N \Rightarrow One to Many,</p> <p>M:N \Rightarrow Many to Many [Must Use different letters for M:N]</p> <p>NOTE: If Cardinality and Participation is not Clearly mentioned OR can't be inferred from Question, Make Logical Assumption</p>		<p>Disjoint $\Rightarrow d$</p> <p>Overlapping $\Rightarrow o$</p>

- **Schema Mapping**

Step 1: Mapping of Regular/Strong Entity Types [Primary Key should be underlined]

Step 2: Mapping of Weak Entity Types [Both Partial Key and Foreign key of Strong Entity should be underlined]

Step 3: Mapping of Binary 1:1 Relation Types

Put the FK in the relation/table that has Total Participation, Otherwise any relation is fine.

(Not underlined, must use arrow head to point towards referenced PK)

Step 4: Mapping of Binary 1:N Relationship Types

Put the FK in the relation that is in the N side

(Not underlined, must use arrow head to point towards referenced PK)

Step 5: Mapping of Binary M:N Relationship Types

Create another relation with both participating entities Key as composite key

(Both underlined, and both are FK so they should point to their respective PK)

Step 6: Mapping of Multivalued attributes

Create another relation with the key of that entity and multivalued attribute

(Both key and attribute must be underlined. FK must point towards PK)

Step 7: Mapping of N-ary Relationship Types

Relationship relation with n FKs

Superclass / Subclass schema mapping

8A: Can be applied for all types (total or optional, disjoint or overlapping)

8B: Can be applied if the specialization is **Total Only**

8C: Can be applied if the specialization is **Disjoint Only**

8D: Can be applied for all types (total or optional, disjoint or overlapping)

- Option 8A: Multiple relations-Superclass and subclasses
- Option 8B: Multiple relations-Subclass relations only
- Option 8C: Single relation with one type attribute
- Option 8D: Single relation with multiple type attributes

SCHEMA EXAMPLE MAPPING [Pictures Attached, Link Below]

- **Binary Relationships**
- **Specialization/ Generalization**
- **Multivalued**
- **Recursive M:N**

- Normalization
 - 1NF disallows
 - composite attributes
 - multivalued attributes
 - nested relations
 - 2NF
 - Must be in 1NF,
 - All attributes depend on the whole key. Must be Fully Functionally Dependent (transitive dependencies can exist in 2NF)
 - 3NF
 - Must be in 2NF
 - All attributes depend on nothing but the key (No transitive dependencies exist)
 - [Normalization Example Solved \[Quiz\]](#)
- Indexing
 - Primary vs secondary index
 - Sparse vs Dense index
 - [B+ Tree Simulation](#)
- SQL
 - Select
 - From
 - Where
 - Group by
 - Having
 - Order by
 - Like %, _
 - Aggregate functions (min, max, count, sum, avg)
 - Subquery
 - Inner join
